Aim: Set up Python environment for AI and implement a simple reflex or goal-based agent in a toy environment.

Program:

```
print("Hello! I am Python")
print("Today we will build a cleaning Robot together.")
print(2+3, "is the answer of 2+3")

room = ["D", "c", "D", "D", "c"]

def show_room(room):
    picture = ""
    for spot in room:
        if spot == "D":
            picture += "dirty "
        else:
            picture += "clean "
    print(picture)

print("Our room right now:")
show_room(room)

def clean_spot(spot):
     if spot == "D":
         return "c"
    else:
        return "c"

result = clean_spot("D")
print("The robot looked at the dirty spot and made it:", result, "(c means clean)")

print("Before - the dirty room:")
show_room(room)

for i in range(len(room)):
    room[i] = clean_spot(room[i])
    print("After cleaning spot number", i+1, ":")
    show_room(room)

print()
print("After - all done!")
```

Output:

```
Hello! I am Python
Today we will build a cleaning Robot together.
5 is the answer of 2+3
Our room right now:
dirty clean dirty dirty clean
The robot looked at the dirty spot and made it: c (c means clean)
Before - the dirty room:
dirty clean dirty dirty clean
After cleaning spot number 1 :
clean clean dirty dirty clean
After cleaning spot number 2 :
clean clean dirty dirty clean
After cleaning spot number 3 :
clean clean clean dirty clean
After cleaning spot number 4 :
clean clean clean clean clean
After cleaning spot number 5 :
clean clean clean clean clean

After - all done!
```
